

Third time's the charm!

It takes three doses of the HPV vaccine to be fully protected.

- The HPV vaccine protects against the two main viruses that cause cervical cancer.
- Every day 12,000 people ages 15 to 24 are infected with HPV.
- HPV often has no signs or symptoms.
- The HPV vaccination series is recommended for females ages 11-26.
- Dependents up to age 26 may be covered by their parents' insurance. Talk to your healthcare provider about coverage.
